## Algorithmic game theory – Tutorial 3\*

November 12 2020

## 1 $\varepsilon$ -Nash and correlated equilibria

Let G = (P, A, u) be a normal-form game of n players and let  $\varepsilon > 0$ . A strategy profile  $s = (s_1, \ldots, s_n)$  is an  $\varepsilon$ -Nash equilibrium if, for every player  $i \in P$  and for every strategy  $s_i' \in S_i$ , we have  $u_i(s_i; s_{-i}) \ge u_i(s_i'; s_{-i}) - \varepsilon$ .

Let p be a probability distribution on A, that is,  $p(a) \ge 0$  for every  $a \in A$  and  $\sum_{a \in A} p(a) = 1$ . The distribution p is a *correlated equilibrium* in G if

$$\sum_{a_{-i} \in A_{-i}} u_i(a_i; a_{-i}) p(a_i; a_{-i}) \ge \sum_{a_{-i} \in A_{-i}} u_i(a_i'; a_{-i}) p(a_i; a_{-i})$$

for every player  $i \in P$  and all pure strategies  $a_i, a_i' \in A_i$ .

**Exercise 1.** Show that, in every normal-form game G = (P, A, u), every convex combination of correlated equilibria is a correlated equilibrium.

**Exercise 2.** Let  $G = (P = \{1, 2\}, A, u)$  be a normal-form game of two players with  $A_1 = \{U, D\}$  and  $A_2 = \{L, R\}$  with payoff function u depicted in Table 1.

$$\begin{array}{c|cccc} & L & R \\ \hline U & (1,1) & (0,0) \\ D & (1+\frac{\varepsilon}{2},\,1) & (500,500) \\ \end{array}$$

Table 1: A game from Exercise 2.

Show that there is an  $\varepsilon$ -Nash equilibrium s of G such that  $u_i(s') > 10u_i(s)$  for every  $i \in P$  and every Nash equilibrium s' of G. In other words, there might be games where some  $\varepsilon$ -Nash equilibria are far away from any Nash equilibrium.

**Exercise 3.** Let  $G = (P = \{1, 2\}, A, u)$  be a normal-form game of two players with  $A_1 = \{U, D\}$  and  $A_2 = \{L, R\}$  with payoff function u depicted in Table 2.

Table 2: A game from Exercise 3.

- (a) Compute all Nash equilibria of G and draw the convex hull of Nash equilibrium payoffs.
- (b) Is there any correlated equilibrium of G (for some ditribution p) that yields payoffs outside this convex hull?
