# Exercises for Combinatorial and Computational Geometry <br> Series 6 - bonus problems 

deadline: 10. 2. 2017

1. Let $\mathcal{C}$ be the set of all cells (faces of maximum dimension) in an arrangement of $n$ lines in the plane. Prove that $\sum_{C \in \mathcal{C}} f_{0}(C)^{2}=O\left(n^{2}\right)$, where $f_{0}(C)$ denotes the number of vertices of a cell $C$.
2. Let $S$ be a set of $n$ geometric objects in the plane. The intersection graph of $S$ is a graph on $n$ vertices that correspond to the objects in $S$. Two vertices are connected by an edge if and only if the corresponding objects intersect.
(a) The total number of all graphs on $n$ given vertices is $2^{\binom{n}{2}}=2^{n^{2} / 2+O(n)}$. Prove that the total number of all intersection graphs of $n$ line segments in the plane is only $2^{O(n \log n)}$. (Be careful and consider also collinear line segments!) Use the theorem about the number of sign patterns.
(b) Show that the number of intersection graphs of $n$ simple curves in the plane is at least $2^{\Omega\left(n^{2}\right)}$. If you wish, you can solve this exercise for $n$ convex sets instead of simple curves.
3. Let $P=\left\{p_{1}, p_{2}, \ldots, p_{n}\right\}$ be a set of $n$ points in the plane. We say that points $x, y$ have the same view of $P$ if the points of $P$ are visible in the same cyclic order from $x$ and $y$. That is, if we rotate light rays that emanate from $x$ and $y$, respectively, the points of $P$ are lit in the same order by these rays. We assume that neither $x$ nor $y$ is in $P$ and that neither of them can see two points of $P$ in occlusion.
(a) Show that the maximum number of points with mutually distinct views of $P$ is $O\left(n^{4}\right)$.
(b) Show that the bound $O\left(n^{4}\right)$ cannot be improved in general.
4. Show that for every positive irrational number $\alpha$ there are infinitely many pairs of numbers $m, n \in \mathbb{N}$ such that

$$
\begin{equation*}
\left|\alpha-\frac{m}{n}\right|<\frac{1}{n^{2}} . \tag{1}
\end{equation*}
$$

Use Theorem 2.1.3 from the lecture notes.
5. Prove that for $\alpha=\sqrt{2}$ there are ony finitely many pairs $m, n \in \mathbb{N}$ that satisfy

$$
\left|\alpha-\frac{m}{n}\right|<\frac{1}{4 n^{2}} .
$$

6. Let $\alpha_{1}, \alpha_{2}$ be real numbers. Prove that for every $N \in \mathbb{N}$ there exist $m_{1}, m_{2} \in \mathbb{Z}$, $n \in \mathbb{N}, n \leq N$ such that

$$
\begin{equation*}
\left|\alpha_{i}-\frac{m_{i}}{n}\right|<\frac{1}{n \sqrt{N}}, \quad i=1,2 . \tag{3}
\end{equation*}
$$
